Chaperonze Treatment Results

Mr. Rich

This is a summary of results of patient Mr. Rich, over a 24-month period.

Age: 64

Sex: Male

Clinical conditions: low libido, frequent nighttime urination, declining eyesight

Response to Treatment:

Increased libido

Urinary competence

Stabilization of eyesight

Testimonial:

"Since using Chaperonze my libido has improved as has my overall energy level. My libido whilst there, had slowed. I now have the libido I remember from when I was in my 20's and 30's. I also had to get up twice nightly for a "pee" but that has now stopped after taking Chaperonze. Last night, I got an uninterrupted night's sleep!

Before initiating Chaperonze treatment, my eyesight had been slowly declining, needing a new prescription on a regular basis. I have not had the need for new glasses at all since taking Chaperonze. I would advise anyone to take this game changing treatment"

Blood Test Results:

As can be seen in the graphs below, there has been a dramatic increase in IGF-1, which has been sustained for 24 months. This certainly would account for the increased energy and libido of the patient. The IGF-1 essentially doubled with treatment and this effect has been maintained over 2 years. Linked with this is the significant decrease (approximately 50%) of HSP70, which mirrors the increasing growth hormone effect.

Essentially, this shows that the Mr. Rich's cells and metabolism have been positively and significantly altered. Essential biomarkers of aging have not only been halved, but they have remained this way over an extended 2-year period of quarterly treatment.
